DATE MAILED: 11/09/2006

Please find below and/or attached an Office communication concerning this application or proceeding.

14

Office Action Summary	Application No. 10/605,736	Applicant(s) WANG ET AL.	
	Examiner Paul A. Wartalowicz	Art Unit 1754	

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --
Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

- 1) ☒ Responsive to communication(s) filed on 06 September 2006.
- 2a) ☐ This action is **FINAL**. 2b) ☒ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

- 4) ☒ Claim(s) 1-11 and 13-15 is/are pending in the application.
- 4a) Of the above claim(s) 12 and 16-27 is/are withdrawn from consideration.
- 5) ☐ Claim(s) _____ is/are allowed.
- 6) ☒ Claim(s) 1-11 and 13-15 is/are rejected.
- 7) ☐ Claim(s) _____ is/are objected to.
- 8) ☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☒ The drawing(s) filed on 22 October 2003 is/are: a) ☐ accepted or b) ☒ objected to by the Examiner.
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All b) ☐ Some * c) ☐ None of:
1. ☐ Certified copies of the priority documents have been received.
 2. ☐ Certified copies of the priority documents have been received in Application No. _____.
 3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

* See the attached detailed Office action for a list of the certified copies not received.

DETAILED ACTION

Response to Arguments

Applicant's arguments with respect to claims 1-11 and 13-15 have been considered but are moot in view of the new ground(s) of rejection.

Claim Rejections - 35 USC § 102/103

The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

The factual inquiries set forth in *Graham v. John Deere Co.*, 383 U.S. 1, 148 USPQ 459 (1966), that are applied for establishing a background for determining obviousness under 35 U.S.C. 103(a) are summarized as follows:

1. Determining the scope and contents of the prior art.
2. Ascertaining the differences between the prior art and the claims at issue.
3. Resolving the level of ordinary skill in the pertinent art.
4. Considering objective evidence present in the application indicating obviousness or nonobviousness.

Claims 1, 4-11, and 13-15 are rejected under 35 U.S.C. 102(b) as anticipated by or, in the alternative, under 35 U.S.C. 103(a) as obvious over Gaffney et al. (U.S. 6409940).

Gaffney et al. teach a process for converting hydrocarbon fuel to a product stream comprising hydrogen and carbon monoxide (col. 1, lines 13-20) comprising providing a feed gas mixture comprising an oxygen containing gas and a hydrocarbon fuel (col. 6, lines 47-50) providing a catalytic structure comprising nickel and rhodium (col. 5, lines 50-53) disposed on an alumina support (col. 5, lines 56-58) wherein the support is porous (honeycomb, col. 6, lines 5-22) wherein the catalytic structure is maintained at a temperature from 700-1100°C (col. 6, lines 65-67) wherein the contact time is 10 milliseconds or less (col. 4, lines 18-20).

As to the limitation of about less than about 1 atom% of total carbon in hydrocarbon fuel as elemental carbon and carbon-rich compounds, the prior art teaches a substantially similar process such that any properties resulting from the process of the prior art are substantially similar to those of the claimed invention.

If Gaffney et al. do not inherently teach providing a feed gas mixture comprising a heavy hydrocarbon fuel, it would be obvious based on Gaffney et al. teaching C₁-C₅ hydrocarbons are reacted with oxygen, it would be reasonable that heavy hydrocarbons (such as a C₆ hydrocarbon) are able to be processed similarly by the process of Gaffney et al. and one of ordinary skill in the art would have recognized to do so.

If Gaffney et al. do not inherently teach directing product gas mixture to solid fuel cell system, it would be obvious to one of ordinary skill in the art that the product stream be directed to a solid oxide fuel system because it is known in the art that streams comprising hydrogen can be used for solid oxide fuel systems.

Claims 1-11 and 13-15 are rejected under 35 U.S.C. 102(b) as anticipated by or, in the alternative, under 35 U.S.C. 103(a) as obvious over Schmidt et al. (U.S. 6254807).

Schmidt et al. teach a process for conversion of hydrocarbon fuel to produce an exit gas stream containing hydrogen and carbon monoxide as main reaction products (col. 3, lines 45-47) comprising providing a feed gas mixture comprising an oxygen containing gas and a heavy hydrocarbon fuel (col. 4, lines 10-15, 26-31) providing a catalytic structure comprising rhodium and nickel (col. 6, lines 16-23) on an alumina support (col. 6, lines 1-6) and passing the feed mixture through the catalytic structure at a temperature of 1000°C (col. 3, lines 39-41), wherein the conversion is operated without the addition of steam or water (water or carbon dioxide is added, col. 3, lines 57-58).

If Schmidt et al. does not inherently meet the limitation of conversion operated without the addition of steam or water, it would be obvious to one of ordinary skill in the art modify the reaction conditions based on Schmidt et al. teaching the presence of steam shifts the product in favor of hydrogen and carbon dioxide shifts the product in favor of CO (col. 4, lines 36-40).

It would have been obvious to one of ordinary skill in the art at the time the invention was made to modify the reaction conditions, since it has been held that discovering an optimum value or a result effective variable involved only routine skill in the art. In re Boesch, 617 F.2nd 272, 205 USPQ 215 (CCPA 1980). The artisan would have been motivated to modify the reaction conditions by the reasoned explanation that

Art Unit: 1754

the presence of steam shifts the product in favor of hydrogen and carbon dioxide shifts the product in favor of CO (col. 4, lines 36-40) as taught by Schmidt et al.

Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

The factual inquiries set forth in *Graham v. John Deere Co.*, 383 U.S. 1, 148 USPQ 459 (1966), that are applied for establishing a background for determining obviousness under 35 U.S.C. 103(a) are summarized as follows:

1. Determining the scope and contents of the prior art.
2. Ascertaining the differences between the prior art and the claims at issue.
3. Resolving the level of ordinary skill in the pertinent art.
4. Considering objective evidence present in the application indicating obviousness or nonobviousness.

Claims 1-11 and 13-15 are rejected under 35 U.S.C. 103(a) as being unpatentable over Gaffney et al. (U.S. 6409940) in view of Schmidt et al. (U.S. 6254807).

Gaffney et al. teach a process for converting hydrocarbon fuel to a product stream comprising hydrogen and carbon monoxide (col. 1, lines 13-20) comprising providing a feed gas mixture comprising an oxygen containing gas and a hydrocarbon fuel (col. 6, lines 47-50) providing a catalytic structure comprising nickel and rhodium (col. 5, lines 50-53) disposed on an alumina support (col. 5, lines 56-58) wherein the

Art Unit: 1754

support is porous (honeycomb, col. 6, lines 5-22) wherein the catalytic structure is maintained at a temperature from 700-1100°C (col. 6, lines 65-67) wherein the contact time is 10 milliseconds or less (col. 4, lines 18-20).

Gaffney et al. fail to teach the hydrocarbon is a heavy hydrocarbon comprising a plurality of hydrocarbon molecules with substantially all molecules containing at least 6 carbons such as diesel, jet fuel, or kerosene.

Schmidt et al. teach a process for producing a stream of hydrogen and carbon monoxide (col. 1, lines 5-15) wherein lighter hydrocarbons as well as heavy hydrocarbons can be processed (col. 4, lines 10-15).

Therefore, it would have been obvious to one of ordinary skill in the art at the time applicant's invention was made to provide wherein lighter hydrocarbons as well as heavy hydrocarbons can be processed (col. 4, lines 10-15) in a similar well-known process as taught by Schmidt et al.

Claim 15 is rejected under 35 U.S.C. 103(a) as being unpatentable over Gaffney et al. (U.S. 6409940) in view of Isogaya et al. (U.S. 4331451).

Gaffney et al. teach a process for converting hydrocarbon fuel to a product stream comprising hydrogen and carbon monoxide (col. 1, lines 13-20) comprising providing a feed gas mixture comprising an oxygen containing gas and a hydrocarbon fuel (col. 6, lines 47-50) providing a catalytic structure comprising nickel and rhodium (col. 5, lines 50-53) disposed on an alumina support (col. 5, lines 56-58) wherein the support is porous (honeycomb, col. 6, lines 5-22) wherein the catalytic structure is

maintained at a temperature from 700-1100°C (col. 6, lines 65-67) wherein the contact time is 10 milliseconds or less (col. 4, lines 18-20).

Gaffney et al. fail to teach directing the product gas mixture to a solid fuel cell system.

However, Isogaya et al. teach a process for making a product stream comprising hydrogen and carbon monoxide (col. 1, lines 5-10) and directing product gas to fuel cells (col. 7, lines 35-38).

Therefore, it would have been obvious to one of ordinary skill in the art at the time applicant's invention was made to provide directing product gas comprising hydrogen and carbon monoxide to fuel cells (col. 7, lines 35-38) because it is known in the art to do so as taught by Isogaya et al.

Claim 15 is rejected under 35 U.S.C. 103(a) as being unpatentable over Gaffney et al. (U.S. 6409940) in view of Schmidt et al. (U.S. 6254807) and Isogaya et al. (U.S. 4331451).

Gaffney et al. teach a process for converting hydrocarbon fuel to a product stream comprising hydrogen and carbon monoxide (col. 1, lines 13-20) comprising providing a feed gas mixture comprising an oxygen containing gas and a hydrocarbon fuel (col. 6, lines 47-50) providing a catalytic structure comprising nickel and rhodium (col. 5, lines 50-53) disposed on an alumina support (col. 5, lines 56-58) wherein the support is porous (honeycomb, col. 6, lines 5-22) wherein the catalytic structure is

Art Unit: 1754

maintained at a temperature from 700-1100°C (col. 6, lines 65-67) wherein the contact time is 10 milliseconds or less (col. 4, lines 18-20).

Gaffney et al. fail to teach directing the product gas mixture to a solid fuel cell system.

However, Isogaya et al. teach a process for making a product stream comprising hydrogen and carbon monoxide (col. 1, lines 5-10) and directing product gas to fuel cells (col. 7, lines 35-38).

Therefore, it would have been obvious to one of ordinary skill in the art at the time applicant's invention was made to provide directing product gas comprising hydrogen and carbon monoxide to fuel cells (col. 7, lines 35-38) because it is known in the art to do so as taught by Isogaya et al.

Conclusion

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Paul A. Wartalowicz whose telephone number is (571) 272-5957. The examiner can normally be reached on 8:30-6 M-Th and 8:30-5 on Alternate Fridays.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Stanley Silverman can be reached on (571) 272-1358. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.
